Q: Can't get shift with double parentheses I'm trying to get the shift of a variable between parentheses in the following string:

```
x.x = \\(x.x * (1 - e^(-s.x * (time - time.0))))\\) I use tokens = text.split(" = ") parser = ttk.DoubleParse() while tokens: item = parser.get() tokens.pop(0) tokens.append(parser.get(delimiter=",")) and get this as output: ['(', 'x.x', ',', '(', 'x.x', ',', '(', '1', ',', ',', ',', 'e', '^', '(', ',', 's', ',', ',', '(', ',', 'time', ',', ',', 'time.0', ',', ',', ',', ',)'] As you can see, the shift on the second time comes but with only 1 space after it. Any idea what I'm doing wrong? A: Why did you use DoubleParse? If you use SingleParse, you won't have problems. >>> x = 'x.x = \\(x.x * (1 - e^(-s.x * (time - time.0))))\\)' >>> tokens = re.split(' = ', x) >>> y = ttk.DoubleParse() >>> while tokens: ... item = y.get() ... c6a93da74d
```
